

Building a Data Warehouse using the Medallion Architecture

gold, silver, bronze layers

This project focuses on building a data warehouse using
the **medallion architecture**

The medallion architecture is a data design pattern that
organizes data into progressive quality layers:

bronze, silver and **gold**

Bronze

Extraction Layer

- Raw Data from source systems
- Stored as-is (JSON, CSV etc)
- No Transformation
- Single source of truth

Silver

Transformation Layer

- Data Cleaned, standerdized, enriched
- Enforces Business Logic
- Transformation
- Prepares Analytics ready dataset

Gold

Business Layer

- Business Ready Dataset
- KPI's, Metrics
- Reporting and Analytics
- Data Modeling:
(Star/Snowflake schema)

Tool of Choice

Building this project involved various steps

Data Architecture

ETL Pipeline

Data Cleaning

Data Modeling

Reporting and Analytics

High-Level Diagrams

The Architecture diagrams were designed using proper industry standards, designing the:

- Data Architecture
- Data Flow
- Data Model

Detailed Documentation

Processes and Guides were properly documented in GitHub including the:

- Project Documentation
- Data Catalog &
- Naming Conventions

Data Catalog for Gold

Overview

Naming Conventions

This document outlines the naming conventions used for

General Principles

SQL Data Warehouse and Analytics Project

Welcome to my **Data Warehouse and Analytics Project** This project demonstrates a comprehensive data warehouse and analytics solution, from building a data warehouse to generating actionable insights. Designed as a portfolio project, highlights industry best practices in data engineering and analytics.

Data Architecture

The data architecture for this project follows Medallion **Bronze, Silver, and Gold** layers:

Thank You
